

D-Series Multi-Channel Amps and Volume Controls

The Russound D-Series Digital Amplifiers are robust, high-efficiency amplifiers that support legendary Russound sound quality. Powered at 50W per channel at 8 ohms and 80W per channel at 4 ohms, the D-series are robust enough to support the demands of theater applications, easily transformed into a powerful 160 watt x4 channel amplifier (bridged mode). The D-series amps also provide ample versatility to meet your installation needs, such as running a 5.1 system using 3 channels at 160W and 2 channels at 50W.

The D-Series amplifiers are designed to offer the features custom installation professionals have come to expect. This includes the support of volume controls. The D-series are designed to integrate smoothly with volume controls without the need for any special wiring. When selecting the right volume control for the installation, we recommend choosing a volume control that has a power handling of 100W RMS or higher. This will allow for ample head room to provide the sound quality and power the D-Series are designed to produce.
