

Tech Tip

Wiring new LCD keypads to old CA amps

Older CA-Series Controllers utilize a direct mapping between the screw-down terminals on the back of the CA to the 110 punch-down block on the back of the CA Keypads. The newer CA-LCD2 keypads do not follow this wiring convention and installing them on the older CA amplifier will require you make some color code modifications. **Important:** The connection of new keypads is compatible ONLY with CA-Series Controllers which have 12 Volt trigger outputs. These units were produced in 1999 and later. The 568A color code for the RJ-45 connector on the back of the newer CA series amplifiers has been included for your convenience.

The 568A color code for the RJ-45 connector on the back of the newer CA series amplifiers has been included for your convenience.
